

— CLICK THROUGH RATE PREDICTION

- BY SAADIYA

EDA

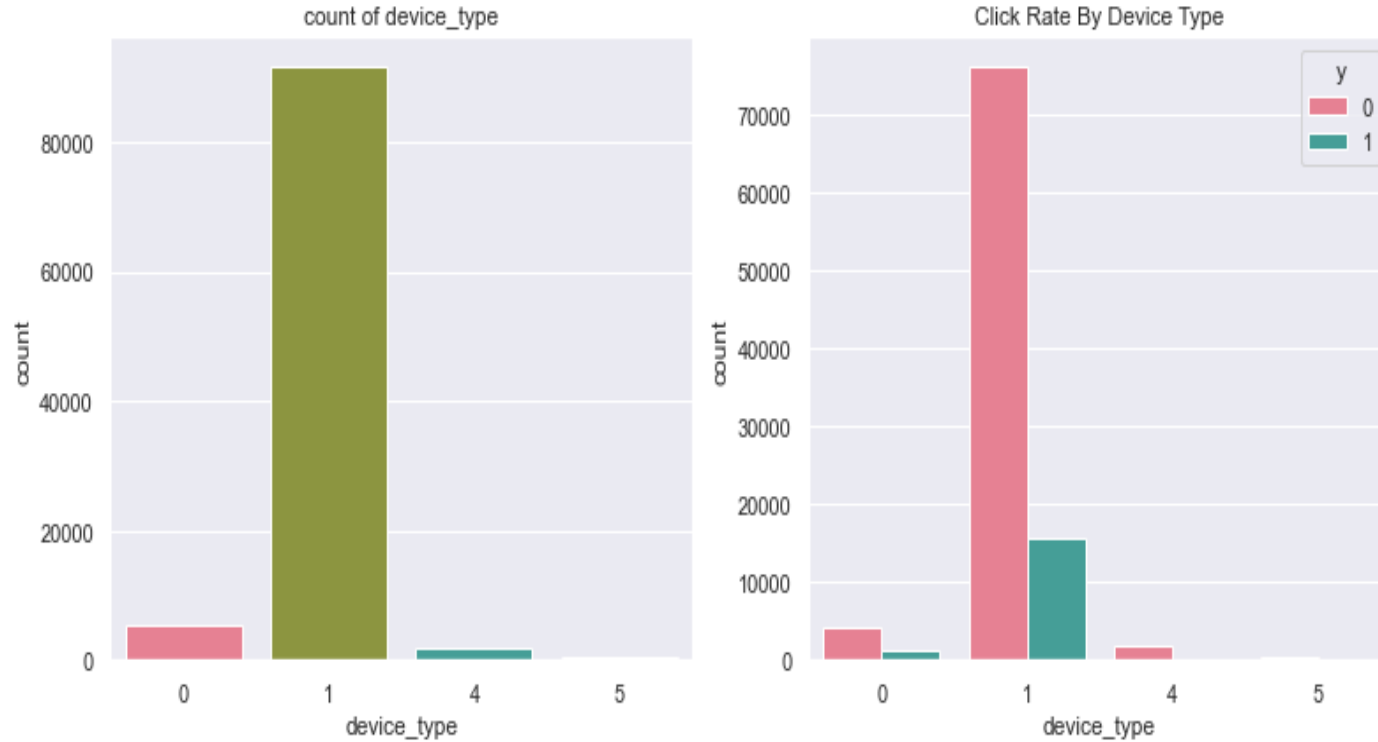

Count of dependent variable:

~16,980 people has clicked the advertisement and ~83,019 people have not clicked the advertisement.

EDA

EDA

Count of Device Type:

Device Type 1 is majorly used.
~16K clicks came from device type 1

PT SAADIYA

Evaluation Metric

Choosing a suitable metric to evaluate model performance

Since there is a considerable class imbalance as can be seen from the data, blindly predicting everything to be 0 will result in the prediction being correct 83% of the time. So Accuracy, Precision, Recall scores will be chosen as the metric for evaluating model performance as optimizing Recall and Precision score will lead to minimizing false-positives and false-negatives which is very desirable in this case.

Risks

Risks of using the model in production

As can be seen from the different models there are large number of false negatives. That is model predicts actual clicks as 0 which may lead the company to miss out on business opportunity.

THANK YOU
